                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- INDUCTION: By fruit ripening.
-!- SIMILARITY: Belongs to the phytoene/squalene synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        phytoene.
-!- PATHWAR: Carotenoid biosynthesis.
-!- SUBGNIT: Monomer (By similarity).
-!- SUBGELLULAR LOCATION: Chloroplast.
-!- DEVELOPMENTAL STAGE: In seedlings and in late stages of fruit.
                                                             v1-CCT-1994 (Rel. 30, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
riptone synthase 1, chloroplast precursor (BC 2.5.1.-) (Fruit Portion PIOMS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        prephytoene diphosphate.

                                                                                                                                                                                                                                                                                   phytoene.
-!- CATALYTIC ACTIVITY: 2 geranylgeranyl diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                          phytoene.
-!- PATHWAY: Carotenoid biosynthesis.
-!- SIMILARITY: Belongs to the phytoene/squalene synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        227 RSAWALATAKQVYRKIGVKVEQAGKQAWDHRQSTSTABKLTLLLTASGQA 276

Patent No. 6291204
GERNRAL INFORMATION:
APPLICANT: Tsygankov, Yuri
ITILE OF INVENTION: Improved Fermentative Carotenoid Production
FILE REFERENCE: Improved Fermentive Carotenoid
CURRENT APPLICATION NUMBER: US/08/980,832B
CURRENT FILING DATE: 1997-12-01
NUMBER OF SEQ ID NOS: 66
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      44.7%; Score 686.5; DB 3; Length 303;

Sequence (4.7.4 Application US/07783705A)
Patent No. 5429939
GENERAL INPORMATION:
APPLICANT: Misawa, No. 5429939ihiko
APPLICANT: Makamura, Katuun
APPLICANT: Yamano, Shigeyuki
TITLE OF INVENTION: DA SEQUENCES USEFUL FOR THE
TITLE OF INVENTION: SYNTHESIS OF CAROTENOIDS
NUMBER OF SEQUENCES: 18
FILING DATE: 18-MAY-1990
PRICAR APPLICATION DATE:
APPLICATION NUMBER: US 07/487,613
FILING DATE: 02-MAR-1990
ATTORNEY/AGENT INFORMATION:
NAMB: Gamson, Edward P.
REGISTRATION NUMBER: 29,381
REFERENCE/DOCKET NUMBER: 29,381
REPERSINCE/DOCKET NUMBER: AMO-006.1
TELECOMMUNICATION INFORMATION:
TELEPHONE: (312) 655-1500
INFORMATION FOR SEQ. ID NO: 8:

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule contoing an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 1

using microorganism having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Methylomonas lea sp. diapophytoene dehydrogenase (CrNX) enzyme used in the invention. (Updated on 07-AUG-2003 to correct OS field.)

The invention relates to a high growth methanotrophic bacterial strain, which grows on a CI carbon substrate e.g. methane and methanol, and comprises a functional Embden-Meyerhof carbon flux pathway comprising a comprises a functional Embden-Meyerhof carbon flux pathway comprising a gene coding a pyrophosphate dependent phosphofrutokinase enzyme or a 16s CRNA. The bacterial strain is useful for the production of single cell protein and for the biotransformation of a nitrogen-containing compound, e.g. ammonia, nitrate, nitrite on introgen til also useful for the production of a feed product comprising a protein, carbohydrates and continities in methane-containing environments such as landfills, waste contributed by a protein of the invention can be used as a continitie of production of beacterial strain of the invention can be used as a carbon source. It is also used in the conformation of biomass including proteins, carbohydrates and a wide compounds, useful as pigments and as carbon source. It is also used in the production of biomass including proteins, carbohydrates and a wide compounds, useful as pigments and as monomers in polyments for the purpose of generating animal feeds), in production of terpenoid and carotenoid compounds, useful as pigments and as monomers in polyment expension of in production of expolysaccharides at high levels. Sequences ABG61551-CR ABG61590 represent high growth methanotrophic bacterial strain proteins
                                                                                                                                                                                                                                                                                                                     New high growth methanotrophic bacterial strain, useful for producing single cell proteins, grows on a Cl carbon substrate, and comprises a functional gene encoding in Embden-Meyerhof carbon pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 11; Page 153-154; 157pp; English.

The invention is useful for obtaining a nucleic acid molecule encoding an isoprenoid compound biosynthetic enzyme, and for the microbial production of isoprenoid compounds. The molecules of the invention are also useful for regulating isoprenoid biosynthesis in an organism and for production recombinant organisms for producing various isoprenoid compounds. The nucleic acid is also useful for feed additive, for the production of keratenoids and their derivatives, isoprenoid intermediates, and as pure products useful as pigments, flavours and fragrances. The present amino acid sequence represents the Methylomonas 16a open reading frame 9 (ORPE) ortNO ((crth copy2) copy 2 of diapophytoene dehydrogenase enzyme) protein of the invention, as described above

The present invention describes nucleic acid sequences encoding carotenoid biosynthetic enzymes (CBES). Also described: (1) a CBE polypeptides; (2) a chimeric gene (CG) containing a CBE linked to regulatory sequences; (3) host cell transformed with CG; (4) obtaining a nucleic acid that encodes a CBE; (5) products of method (4); (6) producing an omega-aldehyde-functionalised carotenoid (X); (7) producing an omega-carboxy-functionalised carotenoid (Y); (8) producing an omega-carboxy-functionalised carotenoid (Y); (8) producing carotenoids (Z); and (9) regulating carotenoid (Y); (8) producing carotenoids (Z); and (9) regulating carotenoid biosynthesis in an organism. CBE sequences have antioxidant activity. CBEs can be used for microbial production of aldehyde-or carboxy-functionalised carotenoids antioxidants, e.g. as feed additives. The present sequence represents a USFANZ CBE protein isolated from Methylomonas sp. strain 16a, which is used in the exemplification of the present invention.

The present invention describes mucleic acid sequences encoding carotenoid biosynthetic enzymes (CBEs). Also described: (1) a CBE polypeptides; (2) a chimeric gene (CG) containing a CBE linked to regulatory sequences; (3) host cell transformed with CG; (4) obtaining a mucleic acid that encodes a CBE; (5) products of method (4); (6) producting an omega-carboxy-functionalised carotenoid (X); (7) producing carotenoids (2); and (9) regulating carotenoid (Y); (8) producing CG carotenoids (2); and (9) regulating carotenoid biosynthesis in an organism. CBE sequences have antioxidant activity. CBEs can be used for microbial production of aldehyde- or carboxy-functionalised carotenoids and c30 carotenoids, and are potentially useful as pigments and art potentially useful as pigments and carotenoids, e.g. as feed additives. The present sequence represents a crivial carotenoid isolated from Staphylococcus aureus, which is used in the exemplification of the present invention.

New nucleic acid encoding carotenoid biosynthesis enzymes, useful for preparing functionalized carotenoids, e.g. pigments and antioxidants, also encoded polypeptides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is nucleic acid encoding the protein, or an antibody to the protein, is present as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of the novel S. aureus proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            126

                                                                                                                                                                                                                                                                                                                                                                           PIDIQAKYYSNQGSIYGVVADRFKNLGFKAPQRSSELSNLYFVGGSVNPGGGMPMYTLSG 485
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             essential gene; cell proliferation; drug design

or screening New antisense nucleic acids, useful for identifying proteins or scre for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 71801; 1766pp; English

The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid concaning the vector; (3) an isolated concupied encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, (7) identifying a compound that influences the activity of the approximated provides or that has an activity against a biological pathway required for proliferation, or that that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a compround that inhibits proliferation of an organism acts; (1) a culture comprising strains in which the test compound that inhibits of activity; (1) a culture comprising strains in the gene product is overexpressed or underexpressed; (12) determining the extent of the which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibite the proliferation of an organism. The autisense nucleic acids are useful for the form of the confound man inhibite calded are useful for dury drocarams or for acreening for homologous nucleic acids are useful for a dury discours a product and organism or for acreening homologues and a sequence or for acreening to an organism or for acreening candidate molecules are useful for a product and organism or for acreening for produce and organism or for acreening drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences n electronic

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, setuli for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins useful for the identification, to express these proteins. The proteins and to obtain antibodies capable of binding to the express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The used to screen compounds in rational drug discovery programmes. The used to screen compounds in rational drug discovery programmes. The used to acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            126
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         63 IFEKLFEYSKKÇMSDYVTIKRLPHQWRSFFPDGTTIDLYEGIKSTDQHNAILSNKDIEEL 122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               246

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (AD) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, AD and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microrganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. cembrant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful the are sensitive to P. luminescens and the proteins are as virulence facts sanity for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   68 FEALFTGAGKNMADYVQIQKVEPHWRNPPEDGSVIDLCEDAETQRRELDKLGPGTYAQFQ 127

There are a total of six relevant genes in a 7900 bp region that cause B. coli cells to produce GGPP and the carotenoids phytoene through caractenin diglicoside, which is the final prod. identified in the carotenoid pathway contd. in plasmid patG376 (contg. a ca. 13 kb chromosomal DNA fragment isolated by Perry et al., J. Bacteriol., 168:607 (1986). The genes for geranylgaranyl pyrophosphate (GGPP) synthase, phytoene synthase, phytoene deranylgaranyl pyrophosphate (GGPP) synthase, phytoene daxanthin glycosylase are represented in AAQ13716, AAQ13718, AAQ13719, AAQ13722, AAQ13724 and AAQ13726 beta-respectively. Recombinant expression plasmids can be used to produce large ants. of the enzymes and hence large ante. of the carotenoids which they synthesise. Carotenoids are pigments with a variety of applications.

```

```
There are a total of six relevant genes in a 7900 bp region that cause E. coli cells to produce GGPP and the carotenoids phytoene through seaxanthin diglucoside, which is the final prod. identified in the carotenoid pathway confd. in plasmid pARG376 (cong. a ca. 13 Kb chromosomal DNA fragment isolated by Perry et al., J. Bacteriol., 168:607 (1986). The genes for geranylgeranyl pyrophosphate (GGPP) synthase, phytoene synthase, phytoene dehydrogenase-4H, lycopene cyclase, beta-carotene hydroxylase, and zeaxanthin glycosylase are represented in AAQ13715, AAQ13719, AAQ13722, AAQ13724 and AAQ13724 and AAQ13726 respectively. Recombinant expression plasmids can be used to produce large ants. of the enzymes and hence large ants. of the carotenoids which they synthesise. Carotenoids are pigments with a variety of applications. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       183
